Project Title	F1 Racing Data Analytics using Tableau
Maximum Marks	3 Marks

Project Proposal (Proposed Solution) template

This project proposal outlines a solution to address a specific problem. With a clear objective, defined scope, and a concise problem statement, the proposed solution details the approach, key features, and resource requirements, including hardware, software, and personnel.

Project Overview	
Objective	Build a Tableau solution that helps F1 fans and analysts compare driver and team performance using the supplied championship standings data.
Scope	Current scope: the supplied Tableau workbook, nine worksheets, and two dashboards based on championship_standings. The source Excel file has five tabs, but the other four are not currently connected. Season filters and source-tab integration are proposed future work.
Problem Statement	
Description	F1 performance data is distributed across multiple Excel tabs. The current dashboards use only championship_standings, so detailed race, qualifying, lap, and circuit analysis is outside the present workbook scope.
Impact	The workbook provides an existing visual foundation for comparing points, wins, podiums, poles, average finish, DNFs, titles, and team-driver wins. Benefits are expected; no user research or measured impact was supplied.
Proposed Solution	
Approach	Use the existing Excel-to-Tableau connection and Hyper extract. Review standings fields and metric definitions, document refresh, and validate other tabs before future integration.

Key Features	Two dashboards: F1 Performance Dashboard and F1 Reliability & Titles. Nine current views cover driver/team points, wins, podiums, poles, average finish, DNFs, titles, and team-driver wins. Filters and extra tabs are proposed enhancements only.

Resource Requirements

Resource Type	Description	Specification/Allocation
Hardware		
Computing Resources	Processing environment for data preparation and dashboard refresh	Existing computer capable of running the supplied Tableau workbook and Excel source. Exact sizing was not supplied.
Memory	Memory available to authoring and data processing	Use memory available on the existing Tableau authoring workstation; no separate server requirement was provided.
Storage	Storage for approved source extracts, prepared data, and logs	Source file: F1 Racing Project Dataset.xlsx; workbook uses championship_standings and Hyper extract.
Software		
Frameworks	Analytics preparation and dashboard software	Tableau workbook and Microsoft Excel source file. Tableau Server/Cloud availability is unspecified.
Libraries	Query and transformation components	Tableau workbook aggregations and calculations; no separate SQL or Python dependency is identified.
Development Environment	Authoring tools and version control	Tableau workbook (.twb) and Excel (.xlsx). Tableau version and team version-control process were not provided.
Data		

Data	Source, approximate volume, and data format	F1 Racing Project Dataset.xlsx, five tabs. Current workbook uses championship_standings (311 rows, 2010–2026); other tabs require validation before use.
