Data Preparation

Date	2 November 2026
Team ID	Not provided
Project Name	F1 Racing Data Analytics
Maximum Marks	5 Marks

This preparation summary is based on the supplied Excel and Tableau files. Current dashboards use championship_standings (311 rows; seasons 2010–2026). Snowflake processing is not evidenced.

Activity 1: Identifying and Handling Null Values

Inspection found no blank values in championship_standings, the current Tableau source. No imputation was needed for this sheet; other tabs are not covered.

Validation: above checks apply to championship_standings only. No Snowflake SQL was supplied or executed.

Activity 2: Duplicate Record Handling

The 311 standings rows have no exact duplicates or repeated season+driver key. No rows were removed. Review other source tabs before integrating them.

Validation: above checks apply to championship_standings only. No Snowflake SQL was supplied or executed.

Activity 3: Data Cleaning and Standardization

The current source uses season, driver, team and numeric standings measures. No SQL cleanup is evidenced. Qualifying and race tabs need separate checks for placeholder values and missing data.

Validation: above checks apply to championship_standings only. No Snowflake SQL was supplied or executed.

Activity 4: Data Transformation and Validation

The current Tableau workbook aggregates standings into points, wins, podiums, team points and poles, average finish, DNFs, titles, and a team-driver wins heatmap. It has no filters or parameters. Adding season filters or integrating other tabs remains proposed work.

Validation: above checks apply to championship_standings only. No Snowflake SQL was supplied or executed.
